Opening a New Shopping Mall in Auckland City, New Zealand

By: Rahul Chakraborty

August 2020

Introduction

For many shoppers, visiting shopping malls is a great way to relax and enjoy themselves during weekends and holidays. They can do grocery shopping, dine at restaurants, shop at the various fashion outlets, watch movies and perform many more activities. Shopping malls are like a one-stop destination for all types of shoppers. For retailers, the central location and the large crowd at the shopping malls provides a great distribution channel to market their products and services. Property developers are also taking advantage of this trend to build more shopping malls to cater to the demand. As a result, there are many shopping malls in the city of Auckland and many more are being built. Opening shopping malls allows property developers to earn consistent rental income. Of course, as with any business decision, opening a new shopping mall requires serious consideration and is a lot more complicated than it seems. Particularly, the location of the shopping mall is one of the most important decisions that will determine whether the mall will be a success or a failure. Also, Auckland is one the most promising city for youths in New Zealand, so opening up Shopping Mall can cater really well with the youth over there.

Business Problem

The objective of this capstone project is to analyze and select the best locations in the city of Auckland, New Zealand to open a new shopping mall. Using data science methodology and machine learning techniques like clustering, this project aims to provide solutions to answer the business question: In the city of Auckland, New Zealand, if a property developer is looking to open a new shopping mall, where would you recommend that they open it and what are the best options available with less or minimum competition and where competition is higher for a new start up?

Target audience of the Project

This project is particularly useful to property developers and investors looking to open or invest in new shopping malls in the of New Zealand i.e. Auckland City. This project is timely as the city is currently suffering from oversupply of

shopping malls. Some local newspapers also reported that the true occupancy rates in malls may be as low as 40 per cent in some areas.

Data

To solve the problem, we will need the following data:

- List of neighborhoods in Auckland. This defines the scope of this project which is confined to the city of Auckland, the most populous urban city in the country of New Zealand.
- Latitude and longitude coordinates of those neighborhoods. This is required in order to plot the map and also to get the venue data.
- Venue data, particularly data related to shopping malls. We will use this data to perform clustering on the neighborhoods.

Sources of data and process of extracting data

This Wikipedia [page](#) contains a list of neighborhoods in Auckland, with a total of 70 neighborhoods. We will use web scraping techniques to extract the data from the Wikipedia page, with the help of Python requests and beautiful soup packages. Then we will get the geographical coordinates of the neighborhoods using Python Geocoder package which will give us the latitude and longitude coordinates of the neighborhoods. After that, we will use Foursquare API to get the venue data for those neighborhoods. Foursquare has one of the largest database of 105+ million places and is used by over 125,000 developers. Foursquare API will provide many categories of the venue data, we are particularly interested in the Shopping Mall category in order to help us to solve the business problem put forward. This is a project that will make use of many data science skills, from web scraping (Wikipedia), working with API (Foursquare), data cleaning, data wrangling, to machine learning (K-means clustering) and map visualization (Folium). In the next section, we will present the Methodology section where we will discuss the steps taken in this project, the data analysis that we did and the machine learning technique that was used.
